Login and Registration Module

Student Project User Guide

Item	Details
Module Name	Login and Registration Module
Project Type	Django web application
Database Used	SQLite
GitHub Repository	https://github.com/shravanishinde602/login-registration
Live Website URL	https://login-registration-gt85.onrender.com/
Main Users	Normal users and admin users
Main Purpose	Users can register, log in, open a dashboard, and log out.

1. Introduction

This document explains how to use the Login and Registration module created in Django. The website allows a user to create an account, log in, view a dashboard page, and log out. The admin can manage user accounts from the Django admin panel.

2. User Roles

Item	Details
Visitor	Can open the home page and click Login or Register.
Registered User	Can log in, view the dashboard, and log out.
Administrator	Can use the admin panel to manage users.

3. Website Flow

The basic flow of the website is:

- 1 Open the home page.
- 2 Click Register and create a new account.
- 3 After registration, go to the Login page.
- 4 Enter the username and password.

- 5 After login, the dashboard page opens.
- 6 Click Logout to end the session.

4. Home Page

The home page is the first page of the website. Any user can open it without logging in.

Available actions:

- Login: opens the login page for existing users.
- Register: opens the registration page for new users.

5. User Registration

A new user can create an account using the Register page. The password is saved securely using Django's authentication system.

Registration fields:

- Username
- Email
- Password

Registration steps:

- 1 Click Register from the home page or navigation bar.
- 2 Enter username, email, and password.
- 3 Submit the form.
- 4 If the details are correct, the account is created and the Login page opens.

6. User Login

An existing user can log in with username and password. If the details are correct, the dashboard page opens.

Login steps:

- 1 Open the Login page.
- 2 Enter the registered username.
- 3 Enter the password.
- 4 Click Login.
- 5 If the credentials are valid, the dashboard opens.

Error handling:

- If the username or password is wrong, an error message is shown.
- The user can stay on the Login page and try again.

7. Dashboard Page

The dashboard is a protected page. Only logged-in users can open it. If a user is not logged in, the website sends the user to the Login page.

Dashboard content:

- Welcome message with the username.
- Logout button.
- Admin panel button for admin or staff users.

8. Logout

The logout option ends the current login session and sends the user back to the Login page.

Logout steps:

- 1 Click Logout from the dashboard or navigation bar.
- 2 The active session is ended.
- 3 The Login page opens.

9. Admin Panel

The admin can manage users from Django's built-in admin panel. To use it, a superuser account is required.

Item	Details
Admin URL	/admin/
Required Account	Superuser or staff account
Main Use	View, add, edit, and delete users

Admin tasks:

- View registered users.
- Add new users manually.
- Edit user details such as username, email, staff status, and permissions.
- Delete users when required.

10. Data Storage

The project uses Django's built-in User model. User records are stored in the SQLite database table named `auth_user`.

Important user data:

- Username

- Email address
- Encrypted password
- Staff and admin status

11. Security Notes

- Passwords are not stored as plain text.
- Dashboard access is restricted to logged-in users.
- Logout ends the active user session.
- Admin access should be given only to trusted users.

12. Troubleshooting

Item	Details
Cannot log in	Check that the username and password are correct.
Registration fails	Check all required fields and make sure the email is not already registered.
Dashboard redirects to login	The user is not logged in or the session has expired.
Admin panel access denied	The account may not have staff or superuser permissions.
Bad Request on deployed site	Check the deployed ALLOWED_HOSTS setting.

13. End User Summary

This module completes the basic authentication flow of the website. A user can register, log in, open the dashboard, and log out. The admin can manage users through the Django admin panel.
